

Climate Change, Land Capability and wider implications

The James
Hutton
Institute

Iain Brown, Willie Towers and Sarah Dunn

*The James Hutton Institute
& Centre of Expertise for Climate Change*

Including contributions from Marie Castellazzi, Laura Poggio, James Sample, Alessandro Gimona, David Miller, Gillian Donaldson-Selby

1. Introducing LCA
2. Present and Future Climate Change
3. Soil-Climate Interactions – Dryness/Wetness
4. Wider Implications – Water Quality etc.
5. Climate Variability

Land Capability for Agriculture (LCA)

- Official land classification system for Scotland after 30 years
- Widely used and familiar to planners and land managers
- Classifies land according to physical constraints that restrict its use
 - Soil, climate, topography and vegetation
- Agricultural use – potential productivity and cropping flexibility
- Land is assumed to be maintained by '*reasonable management*'

LCA classes

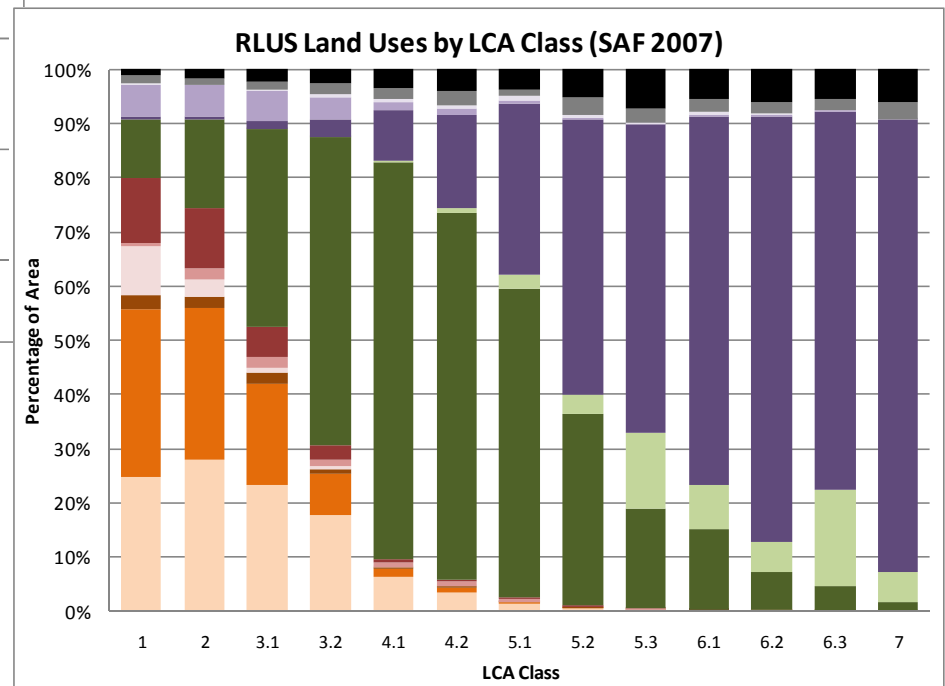

-  Class 1 - very wide range of crops
-  Class 2 - wide range of crops
-  Class 3.1 - moderate range of crops
-  Class 3.2 - moderate range of crops
-  Class 4.1 - narrow range of crops
-  Class 4.2 - narrow range of crops
-  Class 5 - improved grassland
-  Class 6 - rough grazing
-  Class 7 - very limited agricultural value

Prime land

Capable of being
'improved
land'

Scotland's Land Use by LCA class

Source: K. Matthews⁴

HOW DOES LCA WORK?

| Factor | Site Characteristics | LCA Classification |
|--------------------------|---|--------------------|
| Climate | Class 4 (from climatic guidelines) | 4 |
| Topography | 4 degrees | 2 |
| Soil | Freely drained brown earth on stony gravel | 3.2 |
| Wetness class | I | 1 |
| Drought risk | Slight | 1 |
| Pattern | 5-10% wet hollows | 3 |
| Vegetation | N/A | N/A |
| Final LCA classification | | 4 |

Soil-climate interactions

Now implemented by a new digital method for LCA

ORKNEY: LIMITED BY CLIMATE NOT SOILS

Class 4 land

NW HIGHLANDS: LIMITED BY SOILS & TOPOGRAPHY NOT CLIMATE

Class 6.3 land

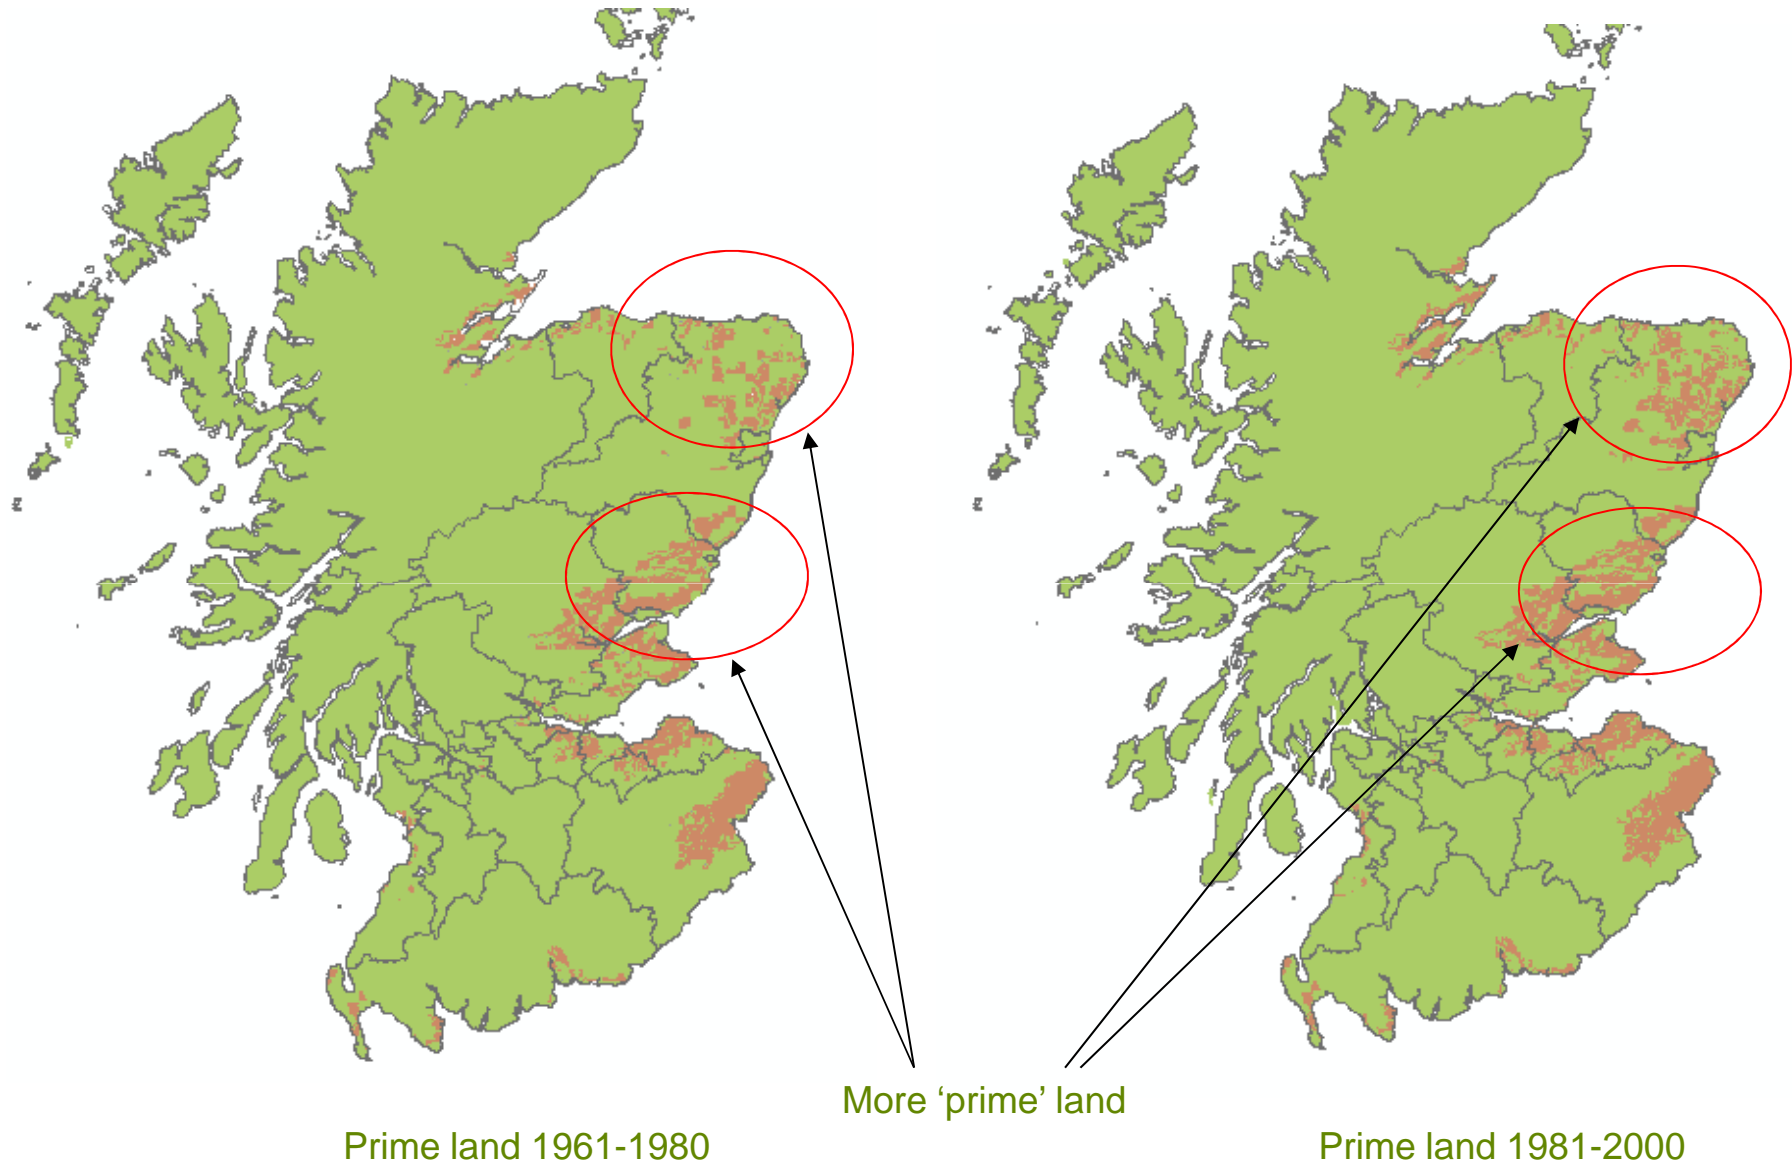

LCA uses 2 main CLIMATE CRITERIA

AT - 'Accumulated temperature' - measure of growing season

SMD - 'Soil moisture deficit' – measure of wetness/dryness

Results: Recent Climate Change

Future climate change - UKCP09

Increased likelihood of:

- Warmer wetter winters
- Warmer drier summers

Average change in Precipitation for 2080s (high emissions)

Future Changes in LCA

- excluding soil/climate interactions

Published version [1982]

2050s projection [UKCP09 q3]

Source: Brown et al. (2008, 2011)

- Increase in extent of prime land
- Potential improvement in 'marginal areas'

Opportunities for
agriculture

What about soil/climate interactions?

Dynamic changes in soil conditions due to weather during the year

- Drought risk and need for irrigation

- Wetness limitations on accessibility

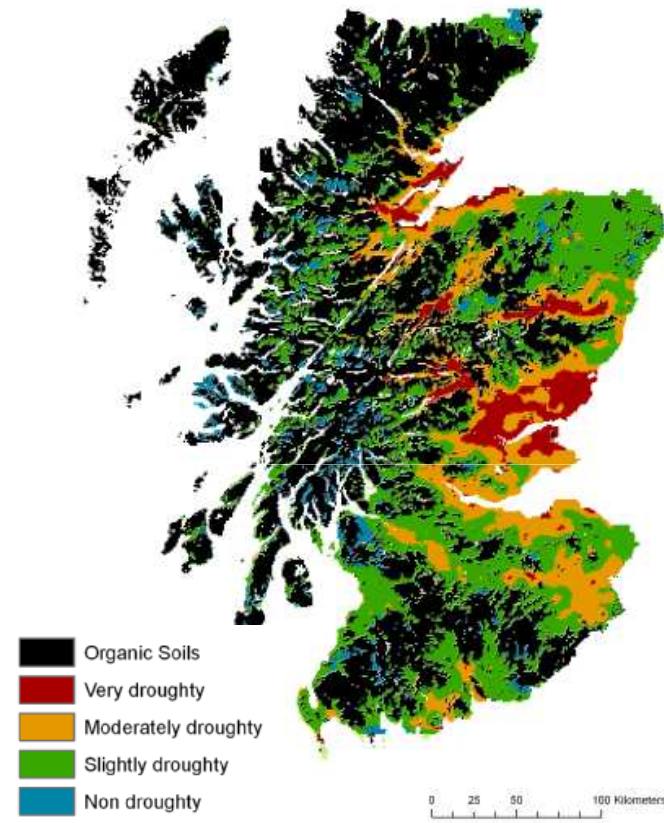

Drought Risk for Indicator crops

e.g. wheat

1981-2000 baseline

2050s projection[UKCP09 q3]

Source: Brown et al (2011)

Shift to warmer, drier summers significantly increases future drought risk

NEED TO ADAPT TO MINIMISE RISKS AND MAXIMISE OPPORTUNITIES

Irrigation? New Crops and crop varieties? Changes in management?

Drought risk & irrigation demand

LCA guidelines:

- PRIME LAND requires that land must be no less than 'slightly droughty' for one of the indicator crops (potato, wheat, barley)
- Irrigation can be included if this is 'feasible' (cf. 'reasonable management')

To maintain/expand 'prime land' may require major increase in irrigation supply

Or alternative adaptation strategies –

- improve water efficiency
- change cropping patterns,
- change varieties etc.

Source: Brown et al (2011)

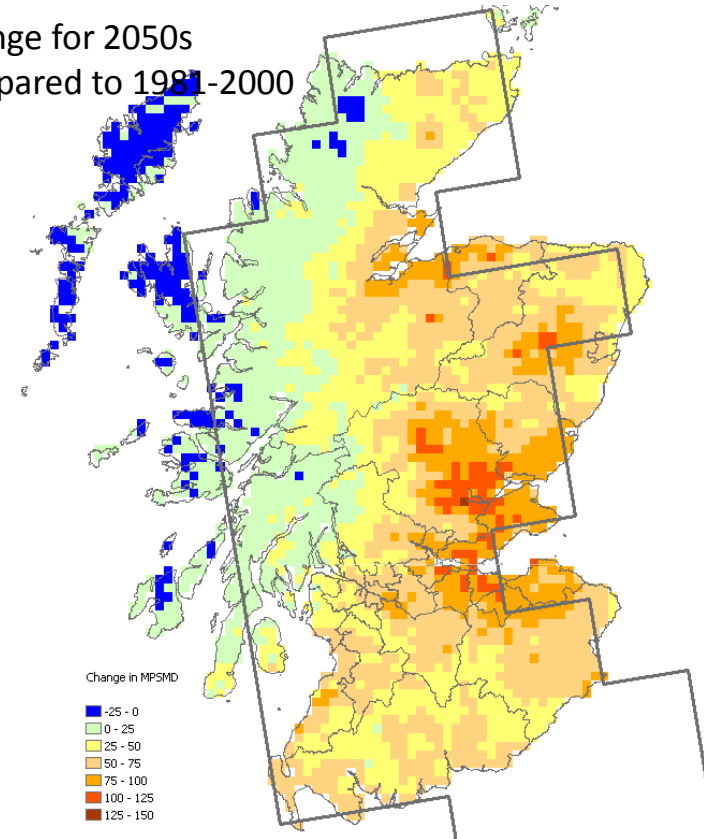

NB water demand already increasing for socio-economic reasons

Wetness

Change 1981-2000
compared to 1961-1980

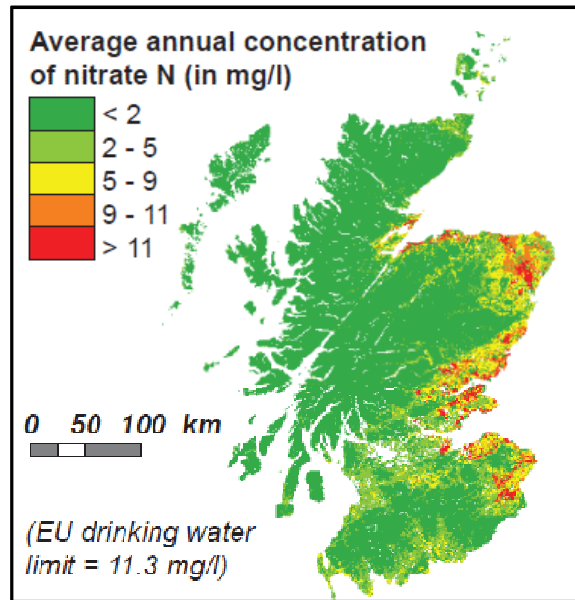

Change for 2050s
compared to 1981-2000

- Possible future improvement for some areas – but may still restrict some marginal areas
- Uncertainty over changes in spring and autumn
- LCA Guidelines probably need revising here

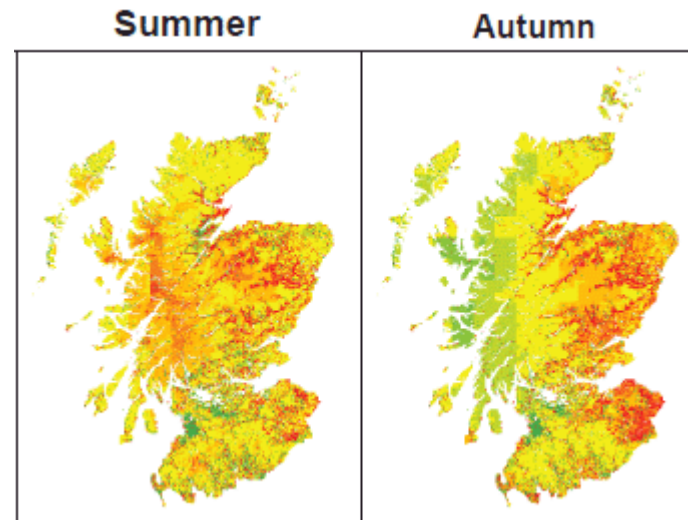

Implications for Water quality – Nitrates

Baseline

Climate change (UKCP09 q3)

Climate change + Land Use scenario (prime land > arable)

- Indirect effects of climate change (via land use) may be as great as direct effects

Wider implications of land use change

Food, water resources and

(Bio) Energy

GHG emissions

Biodiversity

e.g. woodland habitat networks

Land Use Change Scenarios

World Markets – economic growth

National Enterprise - food & energy security

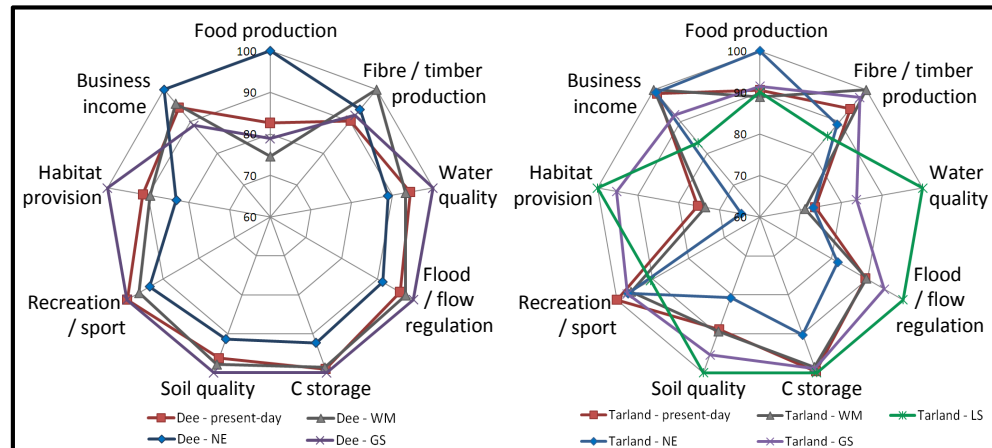

Global sustainability – strong regulation

Implications for Ecosystem Services

DEE CATCHMENT

TARLAND

Visioning Exercises

Local opinion - Ballater Primary School

Remote opinion: Birmingham

- Understand future change, choices and decisions
- How to make best use of our land
- Make climate change less 'abstract'

The James
Hutton
Institute

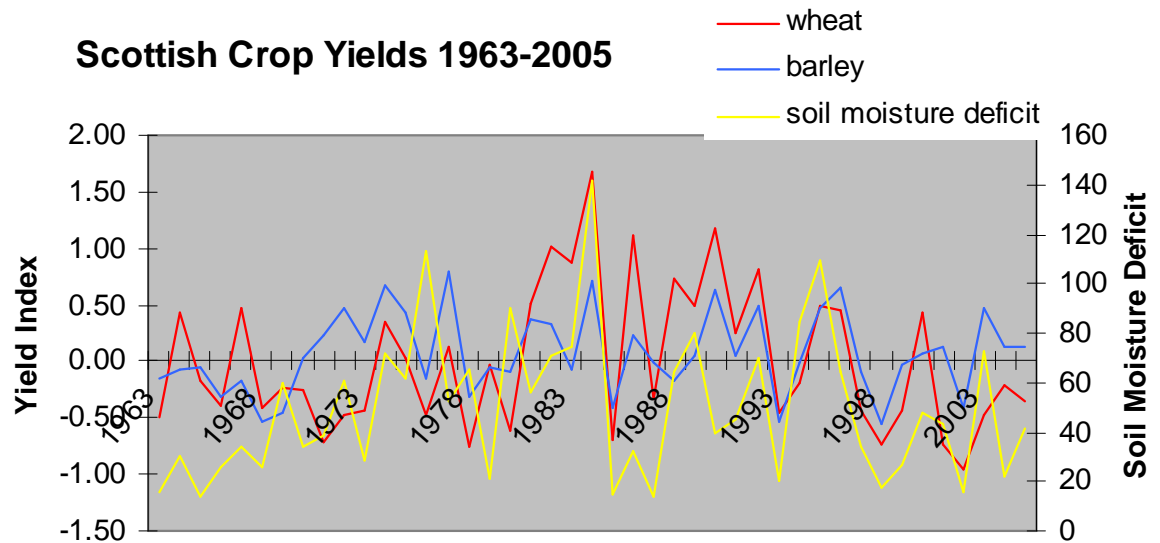

Climate variability

Need to consider variability in addition to long-term average trends

Especially so for Scotland !

Key climate predictors of crop yields (1963-2005)

Scottish Crop Yields 1963-2005

| Crop Yield | Soil Moisture | Sunshine | Mean Temp. | Precipitation |
|------------|---------------|---|------------|------------------------------------|
| Wheat | ** | June**, July**, Annual** | | Nov*, Jun**, Jul**, Annual** |
| Barley | ** | April**, May**, June**, Annual** | | Jul** |
| Oats | * | April**, Annual** | | Jul *, Annual** |
| Potatoes | ** | March**, Annual** | Apr* | Apr** |

Statistical relationships: ** strongly significant * moderately significant

- Evidence also suggests that crops have become more sensitive to climate in recent decades (last 20yrs compared to previous 20 yrs)

Summary

- Climate is changing land capability
 - Prime land – changes in extent
 - Marginal areas – some will become less marginal?
- Land use patterns will respond to this [reactive adaptation]
- Opportunities AND risks – need for planned adaptation
- Implications for food, water, energy, biodiversity, emissions
- LCA can link adaptation/mitigation and spatial planning
- Need indicators/outcomes for ‘reasonable management’

Ongoing work

- Updated version of LCA with a baseline of 1991-2010
- Land use changes in context of changing LCA
- Scenario analysis of potential future changes
